## 1 Vector Spaces

### 1.1 Solution of Simultaneous Linear Equations

Assume  $F = \mathbb{Q}, \mathbb{R}$  or  $\mathbb{C}$ , where  $a_{ij}, b_i \in F$ , then

$$\sum_{j=1}^m a_{ij}x_j = b_i \quad \forall i \in [1, n] : i \in \mathbb{Z}$$

is a **system of linear Equations**

- if all  $b$ 's are 0 then the system is **homogenous**
- $L = \{x_1, \dots, x_m\}$  is the **solution set** of Equations

### 1.2 Fields and Vector Spaces

**DEFINITION 1.2.1.**

1. A **field**  $F$  is a set with functions:

- **addition**  $= + : F \times F \rightarrow F; (\lambda, \mu) \mapsto \lambda + \mu$
- **multiplication**  $= \cdot : F \times F \rightarrow F; (\lambda, \mu) \mapsto \lambda\mu$

such that  $(F, +)$  and  $(F \setminus \{0\}, \cdot)$  are abelian groups, with:

$$\lambda(\mu + \nu) = \lambda\mu + \lambda\nu \in F \quad \forall \lambda, \mu, \nu \in F$$

The neutral elements are called  $0_F, 1_F$ , in particular for all  $\lambda, \mu \in F$

- $\lambda + \mu = \mu + \lambda \in F$
- $\lambda \cdot \mu = \mu \cdot \lambda \in F$
- $\lambda + 0_F = \lambda \in F$
- $\lambda \cdot 1_F = \lambda \in F$

For all  $\lambda \in F$  there exists  $-\lambda \in F$  such that  $\lambda + (-\lambda) = 0_F \in F$

For all  $\lambda \neq 0 \in F$  there exists  $\lambda^{-1} \neq 0 \in F$  such that  $\lambda(\lambda^{-1}) = 1_F \in F$

2. A **vector space**  $V$  over a field  $F$  is a pair consisting of an abelian group  $V = (V, +)$  and a mapping

$$F \times V \rightarrow V; (\lambda, \vec{v})$$

such that for all  $\lambda, \mu \in F$  and  $\vec{v}, \vec{w} \in V$  the following identities hold:

- $\lambda(\vec{v} + \vec{w}) = \lambda\vec{v} + \lambda\vec{w}$  **Distributive Law**
- $(\lambda + \mu)\vec{v} = \lambda\vec{v} + \mu\vec{v}$  **Distributive Law**
- $\lambda(\mu\vec{v}) = (\lambda\mu)\vec{v}$  **Associativity Law**
- $1_F\vec{v} = \vec{v}$

**LEMMA 1.2.1.** If  $V$  is a vector space and  $\vec{v} \in V$  then  $0\vec{v} = \vec{0}$

**LEMMA 1.2.2.** If  $V$  is a vector space and  $\vec{v} \in V$  then  $(-1)\vec{v} = -\vec{v}$

**LEMMA 1.2.3.** If  $V$  is a vector space over a field  $F$  then  $\lambda\vec{0} = \vec{0} \quad \forall \lambda \in F$

### 1.3 Product of Sets and of Vector Spaces

- **Cartesian product** of sets:  $X_1 \times \dots \times X_n := \{(x_1, \dots, x_n) : x_i \in X_i \text{ for } 1 \leq i \leq n\}$ , an element of this product is known as a product n-tuples.

There are special mappings called **projections** for a cartesian product

$$\begin{aligned} \text{pr}_i : X_1 \times \dots \times X_n &\rightarrow X_i \\ (x_1, \dots, x_n) &\mapsto x_i \end{aligned}$$

The cartesian product of  $n$  copies of a set  $X$  is written in short as  $X^n$

$$\forall n, m \geq 0, X^n \times X^m \xrightarrow{\sim} X^{n+m}; ((x_1, \dots, x_n), (x_{n+1}, \dots, x_{n+m})) \mapsto (x_1, \dots, x_n, x_{n+1}, \dots, x_{n+m})$$

### 1.4 Vector Subspaces

**DEFINITION 1.4.1.** A subset  $U$  of a vector space  $V$  is called a **vector subspace** or **subspace** if  $U$  contains the zero vector ( $\vec{0}$ ) and whenever  $\vec{u}, \vec{v}$  and  $\lambda \in F$  we have  $\vec{u} + \vec{v} \in U$  and  $\lambda\vec{u} \in U$

**PROPOSITION 1.4.1.** Let  $T$  be a subset of vector space  $V$  over a field  $F$ . Then amongst all vector subspaces of  $V$  that include  $T$  there is a smallest vector subspace

$$\langle T \rangle = \langle T \rangle_F \subseteq V$$

**DEFINITION 1.4.2.** A subset  $S$  of a vector space  $V$  is called a **generating set** of a  $V$  if its span is all of the vector space. A vector space that has a finite generating set is **finitely generated**

**DEFINITION 1.4.3.** Check Definition 1.4.9 on Iain's (Not me I am Ian) note I dun think it's English

## 1.5 Linear Independence and Bases

**DEFINITION 1.5.1.** A subset  $L = \{\vec{v}_1, \dots, \vec{v}_n\}$  of a vector subspace  $V$  is **linearly independent** if for all arbitrary scalars  $\alpha_1, \dots, \alpha_n \in F$ :

$$\sum_{i=1}^n \alpha_i \vec{v}_i = 0 \rightarrow \alpha_1 = \dots = \alpha_n = 0$$

**DEFINITION 1.5.2.** A subset  $L = \{\vec{v}_1, \dots, \vec{v}_n\}$  of a vector subspace  $V$  is **linearly dependent** if it's not **linearly independent**, which means there exist some  $\alpha_j \in \{a_1, \dots, a_n\}, \alpha_j \neq 0$  such that

$$\sum_{i=1}^n \alpha_i \vec{v}_i = 0$$

**DEFINITION 1.5.3.** A **basis of a vector space**  $B$  of a vector space  $V$  is a linearly independent generating set in  $V$

**DEFINITION 1.5.4.** Let  $F$  be a field,  $V$  a vector space over  $F$  and  $\vec{v}_1, \dots, \vec{v}_r \in V$  vectors. The *family*  $(\vec{v}_i)_{1 \leq i \leq r}$  is a basis of  $V$  if and only if the following "evaluation"

$$\begin{aligned} \Phi : F^r &\rightarrow V \\ (\alpha_1, \dots, \alpha_r) &\mapsto \alpha_1 \vec{v}_1 + \dots + \alpha_r \vec{v}_r \end{aligned}$$

is a bijection

**DEFINITION 1.5.5.** The following for a subset  $E$  of a vector space  $V$  are equivalent: An isomorphism of a vector space to itself is called **an automorphism** of our vector space.

- Our subset  $E$  is a basis, ie. a linearly independent generating set;
- Our subset  $E$  is a minimal among all generating sets, meaning that  $E \setminus \{\vec{v}\}$  does not generate  $V$
- Our subset  $E$  is maximal among all linearly independent subsets, meaning that  $E \cup \{\vec{v}\}$  is not linearly independent for any  $\vec{v} \in V$

**COROLLARY 1.5.1.** Let  $V$  be a finitely generated vector space over a field  $F$ , then  $V$  is a basis

**THEOREM 1.5.1.** Let  $V$  be a vector space.

- If  $L \subset V$  is a linearly independent subset and  $E$  is a minimal amongst all generating sets of our vector with  $L \subseteq E$ , then  $E$  is a basis.
- If  $L \subseteq V$  is a generating set and if  $L$  is maximal amongst all linearly independent subsets of vector space with  $L \subseteq E$ , then  $L$  is a basis.

**THEOREM 1.5.2.** Let field  $F$ ,  $F$ -vector space  $V$  and family of vectors  $(\vec{v}_i)_{i \in I}$  from  $V$ , The following are equivalent:

- The family  $(\vec{v}_i)_{i \in I}$  is a basis of  $V$ ;
- For each vector  $\vec{v} \in V$  there is precisely one family  $(a_i)_{i \in I}$  of elements of field  $F$ , almost all of which are zero and such that:

$$\vec{v} = \sum_{i \in I} a_i \vec{v}_i$$

## 1.6 Dimension of a vector space

**THEOREM 1.6.1** (Fundamental Estimate of Linear Algebra). No linearly independent subset of a given vector space has more elements than a generating set. Thus if  $V$  is a vector space,  $L \subset V$  a linearly independent subset and  $E \subseteq V$  a generating set, then  $|L| \leq |E|$

**THEOREM 1.6.2** (Steinitz Exchange Theorem). Let  $V$  be a vector space,  $L \subset V$  a finite linearly independent subset and  $E \subseteq V$  a generating set. Then there is an injection  $\phi : L \hookrightarrow E$  such that  $(E \setminus \phi(L)) \cup L$  is also a generating set for  $V$

**LEMMA 1.6.1** (Exchange Lemma). Let  $V$  be a vector space,  $M \subseteq V$  a linearly independent subset, and  $E \subseteq V$  a generating subset, such that  $M \subseteq E$ . If  $\vec{w} \in V \setminus M$  is a vector not belonging to  $M$  such that  $M \cup \{\vec{w}\}$  is linearly independent, then there exists  $\vec{e} \in E \setminus M$  such that  $\{E \setminus \{\vec{e}\}\} \cup \{\vec{w}\}$  is a generating set for  $V$

**COROLLARY 1.6.1** (Cardinality of Bases). Let  $V$  be a finitely generated vector space.

- $V$  has a finite basis
- $V$  cannot have an infinite basis
- Any two bases of  $V$  have the same number of elements

**DEFINITION 1.6.1.** The cardinality of one (and by Cardinality of Bases each) basis of a finitely generated vector space  $V$  is called the **dimension** of  $V$  and will be denoted by  $\dim(V)$ . If the vector space is not finitely generated, then we write  $\dim(V) = \infty$  and call  $V$  infinite dimensional. As usual, we will ignore the difference between infinities.

**COROLLARY 1.6.2** (Cardinality Criterion for Bases). Let  $V$  be a finitely generated vector space.

- Each linearly independent subset  $L \subset V$  has at most  $\dim(V)$  elements, and if  $|L| = \dim(V)$  then  $L$  is actually a basis
- Each generating set  $E \subseteq V$  has at least  $\dim(V)$  elements, and if  $|E| = \dim(V)$  then  $E$  is actually a basis.

**COROLLARY 1.6.3** (Dimension Estimate for Vector Subspaces). A proper vector subspace of a finite dimensional vector space has itself a strictly smaller dimension.

**THEOREM 1.6.3** (The Dimension Theorem). Let  $V$  be vector space containing vector subspaces  $U, W \subseteq V$ . Then

$$\dim(U + W) + \dim(U \cap W) = \dim(U) + \dim(W)$$

## 1.7 Linear Mappings

**DEFINITION 1.7.1.** Let  $V, W$  be a vector spaces over a field  $F$ . A mapping  $f : V \rightarrow W$  is called **linear** or more precisely **F-linearly** or even a **homomorphism of  $F$ -vector spaces** if for all  $\vec{v}_1, \vec{v}_2 \in V$  and  $\lambda \in F$  we have

$$\begin{aligned} f(\vec{v}_1 + \vec{v}_2) &= f(\vec{v}_1) + f(\vec{v}_2) \\ f(\lambda \vec{v}_1) &= \lambda f(\vec{v}_1) \end{aligned}$$

- A bijective linear mapping is called as **isomorphism** of vector spaces. If there is an isomorphism between two vector spaces we say them **isomorphic**.
- A **homomorphism** from one vector space to itself is called an **endomorphism** of our vector space.
- An isomorphism of a vector space to itself is called an **automorphism** of our vector space.

**DEFINITION 1.7.2.** A point that is sent to itself by a mapping is called a **fixed point** of the mapping. Given a mapping  $f : X \rightarrow X$ , we denote the set of fixed points by

$$X^f = \{x \in X : f(x) = x\}$$

**DEFINITION 1.7.3.** Two vector subspaces  $V_1, V_2$  of a vector space  $V$  are called **complementary** if addition defines a bijection  $V_1 \times V_2 \xrightarrow{\sim} V$

**THEOREM 1.7.1** (The Classification of Vector Spaces by their Dimension). Let  $n \in \mathbb{N}$ . Then a vector space over a field  $F$  is isomorphic to  $F^n$  i.f.f it has dimension  $n$

**LEMMA 1.7.1** (Linear Mappings and Bases). Let  $V, W$  be vector spaces over  $F$  and let  $B \subset V$  be a basis. Then restriction of a mapping gives a bijection

$$\text{Hom}_F(V, W) = \text{Hom}(V, W) \subseteq \text{Maps}(V, W)$$
